AB The present invention provides isolated **nucleic acid** mols. encoding a herpes virus **thymidine kinase** enzyme comprising one or more mutations, at least one of the mutations encoding an amino acid substitution upstream from a DRH nucleoside binding site which increases a biol. activity of the **thymidine kinase**, as compared to unmutated **thymidine kinase**. Within another aspect, one of the mutations is an amino acid substitution within a DRH nucleoside binding site which increases a biol. Activity of the **thymidine kinase**, as compared to unmutated **thymidine kinase**. Also provided are vectors suitable for expressing such **DNA** mols., as well as methods for utilizing such vectors.

			WO 1997-US5011 W	19970327

AB The present invention provides an isolated **nucleic acid** mol. which is a prostate-specific antigen (PSA) pos. regulatory sequence (PSAR). In one embodiment of the invention, the mol. comprises the **nucleic acid** sequence of PSAR. The sequence can be used to specifically express genes in PSA producing cells. The androgen responsiveness of PSAR in conjunction with PSA gene promoter PCPSA provides a foundation to generate gene therapy vectors for prostate cancer gene therapy. The general example is exemplified by identification of

essential regions responsible for regulating the PSA gene expression specificity using deletion mutagenesis. The findings suggest that an 822-base pair fragment possesses the essential co-regulatory sequence. Injection of PSAR and PCPSA adenoviral vectors into prostate cancer tumors in SCID mice demonstrated tissue specificity of PSAR-PCPSA-P driven transgene expression.

			WO 1997-US4595	19970321

AB The present invention describes homogeneous preps. of a folate receptor-directed metalloprotease (FR-MP), and methods for obtaining and using FR-MP. The purified human placental folate receptor-directed metalloproteinase eluted as a single protein peak on reverse-phase HPLC, and SDS-PAGE revealed a single 63,000 mol.-wt. species, which was reduced to 58,000 mol. wt. following deglycosylation. The corresponding gene, antibodies specific for FR-MP and methods for monitoring FR-MP expression are disclosed. This invention is exemplified by the purifn. of FR-MP from human placenta and the demonstration that post-transcriptional mechanisms are important in the regulation of folate receptor. It was further shown that cells contg. FR-BP expression vectors have increased sensitivity to AZT and increased resistance to methotrexate.

ACCESSION NUMBER: 1997:417206 HCAPLUS
DOCUMENT NUMBER: 127:145627
TITLE: Herpes simplex virus DNA replication
AUTHOR(S): Boehmer, Paul E.; Lehman, I. R.
CORPORATE SOURCE: Dep. Microbiology and Molecular Genetics, Univ. Med., Dentistry New Jersey, New Jersey Med. Sch., Newark, NJ, 07103, USA
SOURCE: Annu. Rev. Biochem. (1997), 66, 347-384
CODEN: ARBOAW; ISSN: 0066-4154
PUBLISHER: Annual Reviews
DOCUMENT TYPE: Journal; General Review
LANGUAGE: English
AB A review with 307 refs. The **Herpesviridae** comprise a large class of animal viruses of considerable public health importance. Of the

Herpesviridae, replication of herpes simplex virus type-1 (HSV-1) has been the most extensively studied. The linear 152-kbp HSV-1 genome contains three origins of DNA replication and approx. 75 open-reading frames. Of these frames, seven encode proteins that are required for origin-specific DNA replication. These proteins include a processive heterodimeric DNA polymerase, a single-strand DNA-binding protein, a heterotrimeric primosome with 5'-3' DNA helicase and primase activities, and an origin-binding protein with 3'-5' DNA helicase activity. HSV-1 also encodes a set of enzymes involved in nucleotide metab. that are not required for viral replication in cultured cells. These enzymes include

a

deoxyuridine triphosphatase, a ribonucleotide reductase, a thymidine kinase, an alk. endo-exonuclease, and a uracil-DNA glycosylase. Host enzymes, notably DNA polymerase .alpha.-primase, DNA ligase I, and topoisomerase II, are probably also required. Following circularization of the linear

viral

genome, DNA replication very likely proceeds in two phases: an initial phase of theta replication, initiated at one or more of the origins, followed by a rolling-circle mode of replication. The latter generates concatemers that are cleaved and packaged into infectious viral particles. The rolling-circle phase of HV-1 DNA replication has been reconstituted in vitro by a complex contg. several of the HSV-1 encoded DNA replication enzymes. Reconstitution of ther theta phase has thus far eluded workers in the field and remains a challenge

for

the future.

SOURCE: Vet. Microbiol. (1996), 53(1,2), 17-29

CODEN: VMICDQ; ISSN: 0378-1135

PUBLISHER: Elsevier

DOCUMENT TYPE: Journal; General Review

LANGUAGE: English

AB A review with 83 refs. Mol. virol. has served to establish bovine herpesvirus 1 (BHV-1) as the prototype member of ruminant herpesviruses. Based on the genomic sequence of the virus, the authors aim to identify and characterize virus-specified components, to explain their concerted action, and to predict how the chain of events during the lytic and

latent

phases of the viral life cycle may be interrupted. The nucleotide sequence of the BHV-1 genome (136 kb) has just been completed by international cooperation (July 1995; except for a small gap in UL36).

It

comprises 67 unique genes and 2 genes, both duplicated, in the inverted repeats. In general, these genes exhibit strong homol. at the amino acid sequence level to those of other alphaherpesviruses (HSV-1, VZV, EHV-1) and are arranged in similar order. A few genes are peculiar to only one or two herpesviruses, e.g. in BHV-1 the circ, UL0.5, UL3.5 and US1.5 genes. Not long ago. the repertoire of BHV-1 proteins under study was restricted to the three major glycoproteins (gB, gC, and gD) and thymidine kinase. The repertoire is now growing rapidly and includes 7 addnl. glycoproteins (gE, GI, gH, gL, gG, gK and gM), a

no.

of enzymes (e.g. ribonucleotide reductase, DNA Polymerase, dUTPase), and a group of regulatory proteins (BICP0, 4, 22, and 27, .alpha.TIF). Investigations into the functions of these proteins and comparison with their counterparts in other herpesviruses should reveal which are useful targets for diagnosis, prevention or antiviral treatment.

Recombinant viruses contg. deletions or replacements of individual genes are being created, aiming at vaccine development and insights into pathogenesis, notably latency, neurotropism, and interference with host functions. Mol. anal. of other ruminant herpesviruses is much less advanced. Over a dozen virus species have been described; most share basic properties with BHV-1 and may be classified as alphaherpesviruses. The gammaherpesviruses are represented by the proposed agent of malignant catarrhal fever, alcelaphine herpesvirus 1, and by bovine herpesvirus 4, whose partial sequences exhibit similarity to herpesvirus saimiri.

L9 ANSWER 7 OF 7 HCAPLUS COPYRIGHT 2001 ACS

ACCESSION NUMBER: 1994:293734 HCAPLUS

DOCUMENT NUMBER: 120:293734

TITLE: Molecular phylogeny of the Alphaherpesvirinae subfamily and a proposed evolutionary timescale

AUTHOR(S): McGeoch, Duncan J.; Cook, Simon

CORPORATE SOURCE: Inst. Virol., Univ. Glasgow, Glasgow, G11 5JR, UK

SOURCE: J. Mol. Biol. (1994), 238(1), 9-22

CODEN: JMOBAK; ISSN: 0022-2836

DOCUMENT TYPE: Journal

LANGUAGE: English

AB Phylogenetic trees were derived for the Alphaherpesvirinae subfamily of the **Herpesviridae** using mol. sequences. Sequences from the families of genes encoding glycoprotein B, **thymidine kinase**, S region protein kinase, immediate-early transcriptional regulator IE175, and ribonucleotide reductase large subunit were examd.

by

both max. parsimony and distance methods and for both protein and DNA alignments. Trees obtained were evaluated by bootstrap anal. A clear consensus tree was obtained, with most detail coming from 14 sequences in the glycoprotein B gene set. The tree showed 2 avian

viruses

branching 1st from the lineage leading to the mammalian alphaherpesviruses. The mammalian viruses were split into 2 groups,

which

corresponded to the Simplexvirus and Varicellovirus genera. A timescale for events in alphaherpesvirus evolution was tested, based on the proposition that most of the lineages arose by ancient cospeciation with hosts. The virus phylogenetic tree was unambiguously compatible with cospeciation for 10 of the 12 mammalian viruses. The tree was also supported by demonstration of an approx. proportionality between magnitudes of pairwise divergences of viral sequences and times since lineages of corresponding pairs of hosts split. On the basis of this timescale, it was estd. that the 2 mammalian alphaherpesvirus groups diverged around the period of the mammalian radiation, and that alphaherpesviral genome sequences have evolved faster than those of mammals by a factor of 1-2 orders of magnitude.
